forvis mazars

WHAT IS **OPENCLAW ?**

OpenClaw is an open-source personal AI agent that runs directly on your own infrastructure. Unlike a standard chatbot, it does not just answer questions — it acts. It reads and writes files, runs code, browses sources in real time, and connects to the tools your teams already use every day. You interact with it through messaging apps you already have: WhatsApp, Slack, Teams, or a web interface

Multi-models

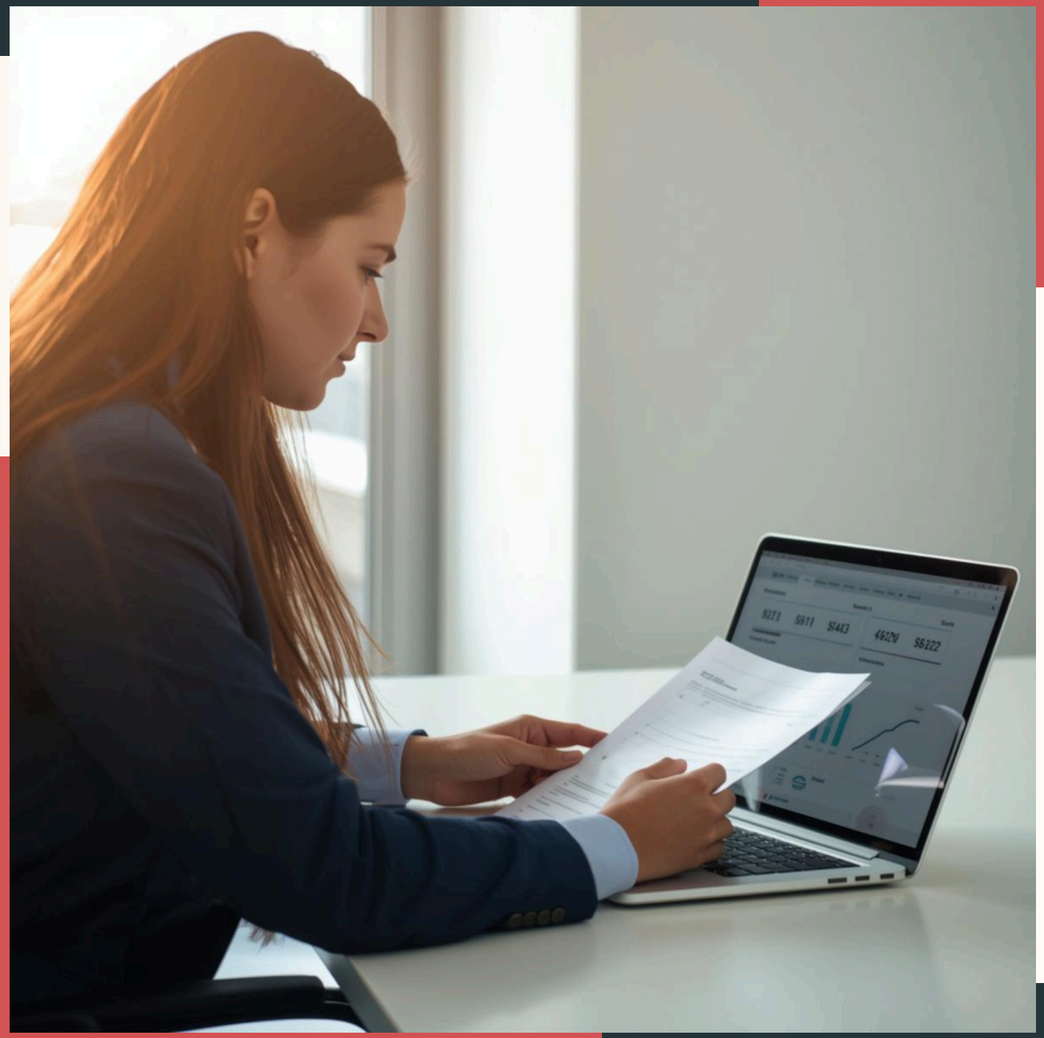

Compatible with Claude, GPT-4o, Gemini, and local on-premise models. Total flexibility to choose the right model for each use case.

Data security

Sensitive data remains at Forvis Mazars, with no transit to a third-party cloud without explicit approval. Native GDPR compliance.

KEY FACTS
OF OPENCLAW

- 68,000+ GitHub stars: created by Peter Steinberger (PSPDFKit founder)
- Runs on your own Mac, Windows, Linux, or private cloud server (VPS)
- 50+ native integrations + 3,000+ community skills via ClawHub
- Officially supported on AWS Lightsail
- Persistent memory: remembers context, preferences, and history across all sessions

SCENARIO A

A tax manager asks OpenClaw to draft an advisory memo on the deductibility of a specific R&D expense. OpenClaw calls Claude to generate the memo, then immediately runs its hallucination detection layer before the memo reaches the manager.

SCENARIO A
STEPS

Manager request via Slack → instantly	1
OpenClaw calls Claude → full note in <30 sec	2
Extraction of verifiable claims (articles, 5. BOFiP)	3
Live verification against BOFiP, Legifrance	4
Color coding (green, orange, red)	5
Audit log stored on VPS — full traceability	6

forvis mazars

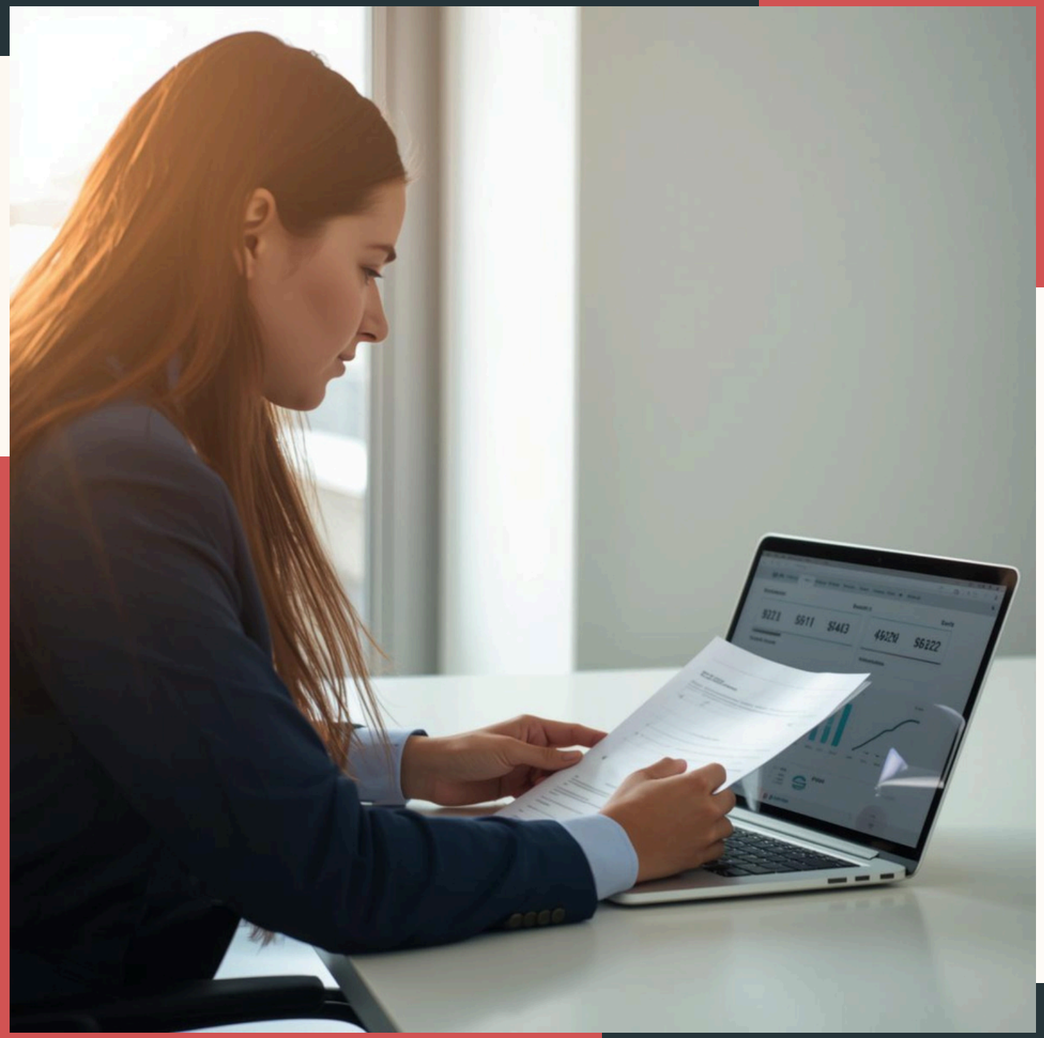

SCENARIO A
WHAT CHANGES?

1 **WITHOUT OPENCLAW**

Junior spends 6–8 hours on manual Excel filtering and work paper writing.

2 **WITH OPENCLAW**

Junior spends 30 minutes reviewing and contextualising the output.
Senior review time reduced from 2 hours to 20 minutes.

SCENARIO B

An audit junior receives a raw SAP export of 75,000 accounting entries. They need to identify all post-closing entries above 50,000 EUR and document them in a work paper. Today this takes a full day. With OpenClaw, it takes minutes.

SCENARIO B
STEPS

uploads the Excel file messages OpenClaw	1
OpenClaw reads the full dataset	2
OpenClaw cross-checks each entry against the trial balance and flags entries	3
Live verification against BOFiP, Legifrance	4
OpenClaw drafts the work paper section in Word format	5
Senior auditor reviews only the 4 flagged entries	6

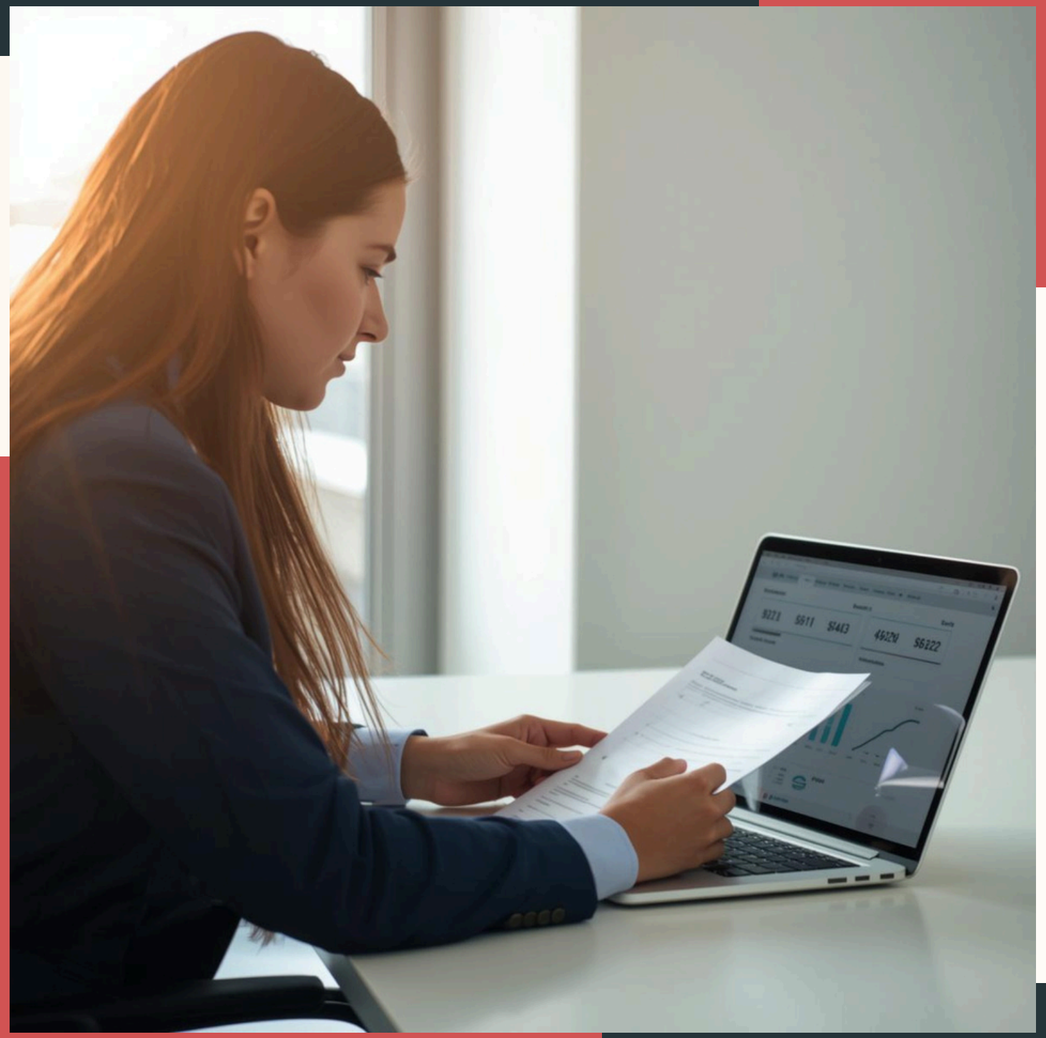

SCENARIO B
IMPACT AND TIME SAVED

1 **WITHOUT OPENCLAW**

2 to 3 hours of work for the complete drafting of the tax note, followed by an exhaustive manual verification of BOFIP, Legifrance, and Case Law sources.

2 **WITH OPENCLAW**

20 minutes of targeted review only on annotated points. Estimated gain: 80% reduction in verification time thanks to automatic detection of hallucinations.

SCENARIO C

OpenClaw can also operate proactively without waiting for a request. Configured as a daily monitoring agent, it scans regulatory sources every morning and alerts the relevant collaborators when something changes that affects their client portfolio.

SCENARIO C
STEPS

Step 1: every day at 7 am

OpenClaw scans BOFiP updates.

Step 2: if a change is detected

OpenClaw identifies which clients in the portfolio are affected.

Step 3: alert sent

Relevant manager receives a Slack message

Step 4: follow-up

Manager replies "Draft a client note for Société X" .

SCENARIO C

STRATEGIC VALUE

Forvis Mazars becomes proactively responsive not reactively catching up.
Differentiator in client retention: clients are alerted before they read it in the press.
Frees tax managers from hours of daily regulatory reading.

INFRASTRUCTURE & **DATA SECURITY**

OpenClaw's access to sensitive client files requires a critical security infrastructure. Confidential data from tax and audit missions requires essential GDPR compliance. A dedicated VPS based in the EU (France or Germany) forms the foundation of this security, ensuring that sensitive data remains under the total control of Forvis Mazars.

VPS INFRASTRUCTURE

- EU Location (France/Germany)
- RAM 16GB minimum, 32GB recommended
- CPU 8+ dedicated vCPUs
- Storage 500 GB encrypted SSD
- Private VPN network + firewall
- Daily encrypted snapshots
- MFA access + role control

VPS INFRASTRUCTURE COMPARED RISKS

1 WITHOUT SECURE VPS

- GDPR violation and exposure of sensitive data.
- Lack of audit trail for regulatory compliance.
- Exposed API keys, risk of compromise.
- Vulnerability to sanctions and reputational loss.

2 WITH SECURE VPS

- Guaranteed GDPR compliance, data stays in the EU.
- Full traceability and integrated audit trail.
- MFA access control and role management.
- Enhanced security with encryption and private VPN.

RECOMMENDATION FOR FORVIS MAZARS

The recommended setup for Forvis Mazars is a dedicated EU-based VPS (OVH, Scaleway, or Hetzner in France or Germany), running OpenClaw with an on-premise model for the most sensitive workflows, and a private Claude API endpoint for advisory tasks where Claude's reasoning quality is required. Both operate behind a VPN layer accessible only to authorised staff.

Phase 1 - Pilot

Deploy VPS with full security configuration in EU datacenter.
Run Scenario A (tax memo verification) with the Tax Compliance team.

Phase 2 - Expansion

Activate Scenario B (audit work papers) with one audit team.
Connect OpenClaw to internal platforms.

Phase 3 - Full deployment

Activate Scenario C (proactive monitoring) across the full tax portfolio.
Scale VPS infrastructure to support all practice lines

S1–4

S5–8

S9–12

THE END GOAL

AI IS TRUSTWORTHY BY DESIGN

The ambition goes beyond efficiency. It is about establishing Forvis Mazars as the benchmark for responsible AI adoption in professional services a cabinet where every AI-assisted deliverable is verified, traceable, and defensible, where collaborators focus entirely on judgment and client relationships, and where the infrastructure that powers it is as rigorous as the professional standards it serves.
